GitterBot CLI

Create & Save "Project file configs."

Create
Repo from
Template

Call Configs to create quick project boilerplate inside
Current working directory (from GitHub template then init.)

gh repo create \${targetOutputRepo} --public --template=https://github.com/\${username}/\${targetTemplateRepo}

JSON Persistence (Needs Trash Collection)

Implement favorite GitHub Templates → Just enter new repo name (repo name = New Project folder)

(push to Inquirer questionArray)

Inquirer Layout

Get user Auth
By placing token off in defaults
